### *Case Study 2*

## ***Maritime Window and Door***

### **Objective**

Maritime Window and Door was having issues with data accuracy within their cut sheets

The main objective was to improve the data configurator and get better information on cut sheets to communicate production needs on the shop floor.

Other needs were to improve the time estimates and inventory accuracy from the production system.

### **Analysis**

After reviewing the information flow, we identified the Bill Of Material was the source of the data discrepancy. Since they use a product configurator to build the Bill of Material based on questions and answers, we needed to improve the configurator database.

The tool used generate the cut sheets was also obsolete and un-supported. So we had to re-build the cut sheets logic using another solution.

### **Implementation**

Maritime Window and Door were using Syspro Manufacturing as an ERP Solution, and within this solution were using the configurator module. Regarding the configurator, Frigault Consultant help identify a key resource within the company to take ownership of the configurator. Also, Frigault Consultant help train the resource and assisted with mass data updates in the backend of the software.

Frigault Consultant also recreated the cut sheets using SQL and MS Access as the report generator. The choice of the tools were selected in order to have the report generator right back to custom SQL tables. They were also built in a way where it could be easily modified as needed.
