

CASE STUDY

Accounting Firm

Problem

A local accounting firm was using different versions of accounting software that caused issues across the company.

In addition, critical information was being stored on local computers without proper backups or disaster recovery plans.

Accountants were looking to work from home but not setup to do so as there was no way for them to securely remote into the office.

Solution

- Setup new terminal server hosted on premise
- Centralized accounting software on main server so everyone is running same software versions
- All users work from the terminal server, which requires them to save files on, for proper backup
- Implemented a disaster recovery solution which is tested daily
- Implemented secure Firewall & VPN remote access to allow work from home

Result

Team is much more productive and efficient.

All data is secure and on premise with offsite backup solution for disaster recovery situation.

Company was prepared with work from home options when COVID-19 required alternative working arrangements.
